FCC Notice
This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy, and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio / TV technician for help.
Changes or modifications not expressly approved by the party responsible for compliance could void the users' authority to operate the equipment.

Professional Installation

In accordance with section 15.203 of the FCC rules and regulations, the Neptune Meter Interface Unit (MIU) must be professionally installed by trained meter installers. Changes or modifications not expressly approved by the party responsible for compliance void the user's authority to operate the equipment.

Industry Canada

This Class B digital apparatus meets all requirements of the Canadian Interference Causing Equipment Regulations. Operation is subject to the following two conditions:

- This device may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

Cet appareillage numérique de la classe B répond à toutes les exigences de l'interférence canadienne causant des règlements d'équipement. L'opération est sujette aux deux conditions suivantes: (1) ce dispositif peut ne pas causer l'interférence nocive, et (2) ce dispositif doit accepter n'importe quelle interférence reçue, y compris l'interférence qui peut causer l'opération peu désirée.

This chapter provides a general description of the 3-inch to 6-inch Neptune® Commercial and Industrial MACH 10® Ultrasonic Meter (C&I MACH 10).

Introduction

Ultrasonic technology:

- Contains no moving parts.
- Provides long-term accuracy.
- Reduces measurement errors due to sand, suspended particles, and pressure fluctuations.

The MACH 10 solid state meter uses ultrasonic transit-time technology and solid state electronics. The C&I meter register is contained in a compact, totally encapsulated, weatherproof, and ultraviolet (UV) resistant housing for commercial and industrial applications.

The C&I MACH 10® ultrasonic water meter features solid state ultrasonic technology including a factory-calibrated, replaceable unitized measuring element (UME) with no degradation of accuracy over time.

Combined with a corrosion-resistant, lead free, high-copper alloy maincase, the C&I MACH 10 is built to withstand any demanding service condition and deliver sustained accuracy over the life of the meter.

The C&I MACH 10 provides a Neptune E-CoderPLUS output signal to Neptune R900® and other Automatic (or automated) Meter Reading (AMR) / Advanced Metering Infrastructure (AMI) endpoints.

The meter's electronics and battery are fully potted to eliminate the intrusion of moisture, dirt, or other contaminants. It is suitable for installation in all environments including meter pits subject to continuous flooding.
Understanding Ultrasonic Technology

An ultrasonic water meter uses high-frequency sound waves to measure the velocity of an acoustically-conductive fluid moving through it. The velocity of the fluid is then converted to volume throughput using sophisticated algorithms and electronics.

Transit-Time Technology

The MACH 10 utilizes transit-time ultrasonic technology. This technology takes advantage of the principle that an acoustic signal travels faster with the flow than against the flow of the fluid. These meters use transducers that are essentially transceivers, sending and receiving the acoustic signals.
In the following image, the dashed lines show the acoustic path.

![Diagram of an MACH 10 flow meter](image)

**Figure 2 – Cross-Section of a 3” Commercial and Industrial MACH 10®**

The difference between the downstream and upstream transit time—the time it takes for the signal to travel from one transducer set to the other—is proportional to the flow rate.

The calculated velocity of the water is then converted to volume based on the area of the measurement section.

**Summary**

The MACH 10 meter is a transit-time ultrasonic flow meter with wetted transducers. Designed as an alternative for mechanical meters, the MACH 10 meter utilizes traditional utility pipe connectors and lay lengths. It is totally self-contained. The C&I MACH 10 battery, processor circuit, and electronic display are fully potted and housed in a replaceable UME. The UME is totally self-contained which not only minimizes field maintenance, but also eliminates the need to remove the main case from service.
The MACH 10 meter provides an E-CoderPLUS output signal to Neptune R900® and other AMR / AMI endpoints. The MACH 10®R900™ contains a MACH 10 meter and an integrated R900 radio for transmitting meter reading data.

</tr>
</tbody>
</table>

Fluid Compatibility

The MACH 10 meter is designed and calibrated for potable, combination potable and fire service, and reclaimed water across the defined temperature and velocity range.

Maincase

The C&I MACH 10 meter maincase is manufactured using lead free bronze and is a pressure vessel that supports the UME. The UME is a replaceable assembly that contains all the elements necessary for accurate measurement and registration of water, such as the transducers, battery, electronics, and register.
Chapter 2: Commercial and Industrial MACH 10® Specifications

Transducers

The piezoelectric transducer is the heart of the system. Although these transducers are very small, they have very high measurement dynamics.

The meter uses dual signal paths. The transducers are permanently installed and the path length and angles are fixed. Each meter is uniquely calibrated at the factory and the calibration data is permanently stored in the meter.

Battery Requirement

Solid state metering technologies require a battery to power the transducers and electronics. With the continued improvements made in battery technology, electronic metering utilizing internal batteries is practical today. The MACH 10 uses lithium thionyl-chloride battery technology.
Chapter 3: General Installation Guidelines

This chapter defines tools, materials, and general installation information for the C&I MACH 10®.

Tools and Materials

The following tables show the recommended tools and materials you need to successfully install the C&I MACH 10 and replace the Unitized Measuring Element (UME).

The tables in this chapter do not contain complete lists of tools and materials.

Safety and Preliminary Checks

Observe the following safety and preliminary checks before and during each installation:

- Verify that you are at the location specified on the site work order.
- Follow all industry and company safety guidelines and procedures.
- Verify that the site is safe for you and your equipment.
- If applicable, notify the customer of your presence, and tell the customer that you need access to the water meter.
- Write the ID number of the MACH 10 meter you are about to install on the site work order. If the site work order already has a MACH 10 ID number, verify that it matches the ID number on the MACH 10 you are about to install.

Installation and Application Considerations

This section provides information to consider before installing the C&I MACH 10.

Water Temperature

The temperature range of the water is a factor in the selection of an ultrasonic meter, since the meter is calibrated to operate within a specified range. The MACH 10 meter is calibrated for water operating temperature between 33° F and 122° F (or 0.5° C and 50° C) measuring applications.

Meter Installation

Install the MACH 10 meter using horizontal or vertical piping applications. The meter features standard lay lengths for ease of retrofit of mechanical meters. A flow direction arrow is visible on the side of the meter and top of the cover to aid in installation in the proper direction.

The C&I MACH 10 does not require any straight pipe upstream or downstream from the meter to meet AWWA C715 standards. For more details, see "Installing MACH 10® Ultrasonic Meters" on page 13.
Water Flow

The MACH 10 meter is unable to measure flow when an empty pipe condition is detected. An empty pipe is defined as a condition when the ultrasonic sensors are not fully wetted. In this situation, the meter displays an Empty Pipe icon ( ) on the register LCD and no measurement occurs.

Should this occur, purge all air from the pipes at the time of test or installation. You can achieve this by loosening the meter bleed screw (see the figures below) located on top of the C&I meter maincase then running as high a flow rate as reasonably possible through the meter. Turn the screw until you can feel water pushing it up and out from the meter maincase. The screw is captured and will not eject from the meter. If you have trouble purging the air, increase the exit pressure and flow rate through the meter. After the LCD shows the expected amount of water being registered, fully re-tighten the meter bleed screw.

![Bleed Screw Location](image)

**Figure 5 – Bleed Screw Location**

![Bleed Screw Details](image)

**Figure 6 – Bleed Screw Details**
Traditional meter sizing methods apply to both electronic meters and mechanical meters. That is, the maximum flow and maximum continuous flow rate requirements should be considered when selecting a meter. Mechanical meters allow a temporary flow at a rate higher than the maximum continuous flow. However, since electronic meters have no moving parts, these two specifications are identical; the maximum flow rate is also the maximum continuous flow rate.

The following table lists the maximum flow rates for the C&I MACH 10 meter.

### Table 8 – Maximum Flow Rates

</tr>
</tbody>
</table>
Chapter 4: Installing MACH 10® Ultrasonic Meters

All MACH 10® ultrasonic meters are delivered activated and ready to be installed. When the meter lid is opened, the meter shows the empty pipe icon and the latest volume on the LCD. The empty pipe icon clears immediately after the meter is installed and the meter measuring pipe is full.

Installation Instructions for MACH 10® Meters

This section defines the step-by-step instructions for installing the MACH 10 meter.

Prior to Installation

This section defines the processes to perform before you install the meter.

Storage

After receipt, inspect the shipping containers for damage and inspect the contents of any damaged cartons prior to storage. After completing the inspection, store the cartons in a clean, dry environment. See Table 1 on page 5.

Unpacking

After unpacking the MACH 10 meter, inspect it for damage. If the meter appears to be damaged, notify your Neptune territory manager or distributor. If a meter requires reshipment, use the original cardboard box and packing material.

Handling the Meter

Only use nylon straps with appropriate weight capacity to lift the meter from its installed lift brackets (found on either side of the register).

DO NOT:
- Lift the meter by the electronic housing unit.
- Carry the meter by its lid.
- Use bolt holes for grip when carrying the meter.
- Position the meter on its electronic housing unit.
Upstream and Downstream Requirements

The C&I MACH 10 does not require any straight pipe upstream or downstream from the meter to meet AWWA C715 standards. Neptune’s flow ranges and accuracy standards exceed those of AWWA, so in order to meet our more stringent standards some configurations may require minimum amounts of straight pipe. Any configuration of a meter with 5 diameters of straight pipe upstream will meet Neptune accuracy standards.

Strainer

![Figure 7 – Install a Strainer Upstream or Downstream](image)

The meter does not require the use of a strainer. If you want a strainer, you can install it immediately downstream the meter or 5 diameters upstream the meter. During meter replacement, if a strainer is already installed upstream, the C&I MACH 10 meets all AWWA C715 accuracy standards for static meters. To attain the meter’s highest accuracy capabilities, consider moving the strainer downstream the meter.
Elbows

You can install elbows (90°) 5 pipe diameters upstream the meter and directly downstream the meter.

Valves

You can install fully open gate valves or ball valves immediately upstream or downstream the meter. Install fully open isolation valves or butterfly valves at least 5 pipe diameters upstream the meter or immediately downstream the meter. If you need control valves, check valves, or backflow preventers, install them downstream of the meter to avoid cavitation. Do not install the meter on a pump suction side.
Test Tee

![Diagram of a Test Tee](image)

**Figure 10 – Install a Test Tee**

If you want a test tee, install it so that the test port is facing straight up, aligned with the meter’s register. The center of the test port must be a minimum of 1 pipe diameter from the outlet flange of the meter. Two-inch test ports are recommended.

### Installation – Commercial and Industrial

Following are the steps to install the C&I MACH 10 meter.

*Although lighter than traditional mechanical meters, take care when moving and lifting the Commercial and Industrial MACH 10 meters. Lift brackets are provided on meters greater than 3” to aid in lifting the meter. Use proper company and government safety guidelines when lifting.*

1. Flush the service line prior to meter installation in order to remove debris and air in the line.
2. If required by company practices, place an electrical grounding strap on the service line, connecting the inlet and outlet service lines on either side of the meter setting.
3. If you are installing the meter in a vault or enclosed area, be sure to follow all utility and industry confined-spaces safety guidelines.
4. Be sure that no debris enters the meter during installation.
5. Place the coupling gaskets, and set the meter in the line.
6. Install the mounting bolts and turn the coupling or flange nuts by hand, then use a wrench to tighten sufficiently to prevent leakage.
7. Slowly open the inlet-side valve to pressurize the meter while the outlet-side gate valve is closed.
8. Slowly open the outlet-side gate valve until the downstream line is pressurized.
9. Turn the bleed screw until you can feel water pushing it up and out from the meter maincase. The screw is captured and will not eject from the meter. For bleed screw location and details, see Figure 5 in Chapter 3.

10. Allow water to flow from the screw location during the entire purge process, (in practice, some air may still be escaping when you see water–leaving the bleed screw open helps guarantee a good purge).

11. Check to see if the meter is operating correctly while the valve is open, then fully re-tighten the meter bleed screw once the LCD shows the expected amount of water being registered. When purging the meter at 50% of its max flow with the bleed screw open, it takes 30 seconds for all trapped air to exit the meter. If you have trouble purging the air, increase the exit pressure and flow rate through the meter and continue to purge a bit longer.

12. Turn OFF the downstream valve and check the meter installation for leaks.

The C&I MACH 10 may take longer to completely remove air from the meter, particularly when flow rates are less than 50% of the maximum flow rate of the meter.
Wiring the MACH 10®

The following table defines the steps to wire the MACH 10 meter to an MIU while you are in the field.

If the meter is not a MACH 10 prewired and potted to an MIU, complete the following steps to wire the MACH 10.

1. Hold the Scotchlok™ between the index finger and thumb with the red cap facing down.

![Figure 11 – Scotchlok™ Connector](image)

2. Take one non-stripped black wire from the pigtail and one from the receptacle / MIU.
3. Insert the wires into the Scotchlok connector.
4. Insert the insulated color wires directly into the Scotchlok connector until fully seated.

![Figure 12 – Seat the Connector Wires](image)

Do not strip the colored insulation from the wires, or strip and twist the bare wires before inserting them into the connector. Insert the insulated colored wires directly into the Scotchlok connector.

5. Place the connector red cap side down between the jaws of the UR crimping tool.
6. Check to ensure the wires are still fully seated in the connector before crimping the connector.
7. Squeeze the connector firmly with the proper crimping tool until you hear a pop and the gel leaks out the end of the connector.
8. Repeat steps 1 through 5 for each color wire.

The following table provides the wiring color schemes for wiring the MACH 10 to various MIU providers.

Table 9 – Color Codes for Wires

</tbody>
</table>
Completing the Wiring

Follow these steps to wire the MACH 10.

1. After you connect all three color wires, read the encoder register to ensure proper connections and the receptacle / MIU is functioning properly.

![Figure 14 – Three Colored Wires Connected](image)

2. Take all three connected Scotchloks and push them into the splice tube until fully enclosed by the silicone grease.

![Figure 15 – Splice Tube](image)
3. Separate each gray wire and place them into the slots on each side.

![Gray Wires in Slot](image)

**Figure 16 – Gray Wires in Slot**

4. Snap the cover closed to finish the installation.

![Cover in Place](image)

**Figure 17 – Cover in Place**
This page intentionally left blank.
Chapter 5: Activating and Reading MACH 10® Ultrasonic Meters

This chapter explains the operations of the MACH 10® ultrasonic meter.

Activating the LCD Meter Display

The light sensor is located in the center of the faceplate of the MACH 10, and it activates the power for the Liquid Crystal Display (LCD) panel.

![Image of MACH 10 meter]

**Figure 18 – Commercial and Industrial MACH 10® Meter**

Timeout Period

Typically, the display is OFF. The meter includes a light sensor used to activate the LCD when you open the meter lid. You cannot reactivate a timed out LCD just by shining a light on the light sensor. To reset the LCD, close and re-open the lid.

Meter Display

The MACH 10 ultrasonic meters use a nine-digit LCD to show consumption, flow rate, and alarm information.
LCD Panel

Following is an example of the MACH 10 LCD panel. The table on the following page provides a description of each icon.

![LCD Panel Example](image)

**Figure 19 – MACH 10® LCD Panel**

The LCD can display commas or decimals, depending on the configuration of each register, to show digits in the tens position, ones position, tenths position, and so forth. For example, some registers display 1,234,567.89. Others display 123,456.789, 12,345,678.9, or 1,234,567,89 depending on the need of the meter/register combination.

How to Read the Meter

It is important to become familiar with the information available from the meter. The icons and displays provide helpful information.

Alarms

Indicators and alarms appear in the displays as symbols that illuminate when the condition is active, and disappear when the alarm condition is eliminated.
LCD Icons

The following table defines the MACH 10 LCD icons and the status they indicate.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
<th>Status</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leak</td>
<td>Icon used to indicate a leak. Leak status is determined by keeping track of the number of 15-minute intervals where the volume consumption exceeds Vmin in the previous 24-hour period. Vmin is factory programmed depending on meter size. It is defined as a change of the ninth digit on the LCD.</td>
<td>OFF</td>
<td>Number of 15-minute intervals where flow was registered &lt; 50.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Flashing</td>
<td>50 ≤ Number of 15-minute intervals where flow was registered &lt; 95.</td>
</tr>

<td></td>
<td>Continuous ON</td>
<td>&lt; One year of battery life remaining or time since first power ON &gt; 9.5 years.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Continuous FLASHING</td>
<td>Low battery or time since first power ON &gt; 10 years.</td>
</tr>
</tbody>
</table>
Consumption and Unit of Measure – Commercial and Industrial

The consumption display contains all nine digits, including leading zeros and a decimal point. The value displayed is the sum of the forward flow minus the reverse flow.

The unit of measure and resolution are factory programmed and options include gallons, cubic feet, and cubic metres.

**Table 11 – Consumption and Units of Measure – Commercial and Industrial**

</tr>
</tbody>
</table>

*Unit cannot be displayed on LCD

Rate of Flow

The rate of flow is factory programmed for either gallons per minute or litres per minute. The LCD displays both the unit of measure and rate of flow. The rate of flow display also serves as the flow finder indicator. The rate of flow display is shown without leading zeros. When rate of flow is displayed, it is updated every two seconds.
Flow Direction

An arrow on the electronic register housing shows the direction of flow. Current flow direction can be viewed on the LCD panel. The direction of flow arrows on the LCD are activated when the meter detects any amount of flow. If the volume of the flow is below a predetermined measurement threshold in a given time period, the meter does not accumulate flow.

AMR / AMI Output

The Neptune MACH 10 Ultrasonic Meter is a compact design where the electronic register is fully potted and permanently sealed to the meter maincase. The meter provides high resolution E-CoderPLUS protocol. It communicates status indicators to the Neptune R900 RF endpoints as part of the extended encoder / meter reading message. The meter also provides ProRead™ protocol for third-party endpoints that are not capable of reading E-CODER® eight digit or E-CoderPLUS protocol.

Endpoint Reading Resolution

The reading resolution sent to the reading software is dependent on the endpoint to which the encoder is connected. Readings reported from the endpoints are the left-most significant digits for the encoding reading.
Bench Testing the Commercial and Industrial MACH 10® Meter

Unlike other solid state meters introduced to the market, the Neptune MACH 10 Ultrasonic Meter is designed to be bench tested as a traditional mechanical meter. However, there are certain best practices you should adhere to when testing the C&I MACH 10 meter. A summary of these are in the following sections.

Meter Accuracy Testing Guidelines

Following are guidelines for testing meter accuracy:

- Conduct meter accuracy tests at a stable flow rate, and keep the variation in flow rates to a minimum during the test.
- Minimize the time it takes to start and stop the test flow rate. Starting the flow should be quicker than stopping the flow to prevent water hammer during the valve closing.
- MACH 10 meters have remarkable low-flow sensitivity. Conducting meter accuracy tests at low-flow rates on a test bench designed to test large meters is challenging, so take care to ensure reliable and consistent results.
- Regularly inspect the test bench to ensure there are no leaks or leaking valves downstream of the meter. Any slight diversion of water away for the tank makes it appear that the meters are over-registering.
- If you test over a range of flow rates, start at the highest flow rate and end with the lowest. This helps ensure that all air is purged before reaching the more critical low flow tests.
- AWWA C-715 specifies visual reading capacity requirements, which dictates the value of the most significant digit. The MACH 10 has a nine-digit LCD display that together with the AWWA capacity requirement determines the resolution of the least-significant digit. Consequently, to ensure that reading errors are acceptably low, run sufficient volumes of water during low-flow testing. Refer to "Test Data " on page 33 for Neptune's recommended test volumes.
- To achieve necessary tank volume precision, low-flow testing should use the smallest practicable tank.
- Best practice is to test three times at each flow rate and average the three results to report the meter accuracy at that flow.
If you use scales to record the weight of water from a test, be sure to check the scales at regular intervals. Converting from weight to volume is necessary and requires a density value. While this is somewhat dependent upon water temperature, a density of 8.34 pounds per gallon is generally used. Therefore, determine the test volume using the following equation when testing in U.S. gallons:

\[
Volume \ [gal] = \frac{Weight \ [lbs]}{8.34 \ \frac{lbs}{gal}}
\]

Use the following equation to compute test volume in cubic feet:

\[
Volume \ [cu. \ ft] = \frac{Weight \ [lbs]}{62.38 \ \frac{lbs}{cu. \ ft}}
\]

**Test Procedure**

You can test the C&I MACH 10 in the same way that a typical mechanical meter is tested. Below are some testing best practices to help you get the most out of your test:

1. Place and secure meter in test bench.

   **Allow a minimum distance of 5 pipe diameters between the bench’s inlet and the meter. If you are testing multiple meters, allow a minimum distance of 5 pipe diameters between subsequent meters.**

2. Close the outlet valves and slowly open the bench fill valve to its fully open position.
3. Open the bleed screw located near the register with a Phillips head screwdriver.

   **Turn the screw until you can feel water pushing it up and out from the meter maincase. The screw is captured and will not eject from the meter. Do this for each meter you test.**
4. Open the tank discharge valves.
5. Slowly open test bench outlet valves until the meter reaches 50% of its max flow.
6. Adjust the input pump's speed (output percentage) or use the test bench outlet valves to throttle the flow until the pressure at the exit of the meter is at least 30 psig.

If there is not at least 30 psi at the exit of the last meter being tested, your high (full) flow test results may not be representative of the actual accuracy of the meter.

7. When the meter is at 50% of max flow and there is at least 30 psig of back pressure on the meter, run water through the meter for at least 30 seconds to purge air out of the meter.

If there is a “PURGE” setting pre-programmed into your bench’s software, Neptune recommends first performing the above 50% flow purge AND THEN running the pre-programmed “PURGE” at least five times. This ensures all pumps and lines used during testing are cleared of air. If there is not at least 30 psi at the exit of the last meter tested, your high (full) flow test results may not represent the actual accuracy of the meter.

8. After each meter is purged of air, tighten the bleed screw until you see no water exiting the meter.
9. Adjust the outlet valves to set the desired flow rate for testing. Start with high (full) flow rate (see Appendix: Table 1), then test intermediate flow rate (see Table 14 on page 33), and finish with low flow rate (Chapter 6 on page 29).
If you are using pre-programmed flow tests and do not have access to either the C&I MACH 10 test profile or AWWA C-715 Ultrasonic test profile, use the AWWA C-701 Turbine meter test profile.

10. After you set the flow and pressurize the flow using the test bench outlet valve, shut off the flow using the test bench outlet valve. Verify that no leaks are present. Leaks can skew results.

If possible, use a separate valve at the test outlet to start / stop flow, so the meters starts and stops the test at line pressure. If there is not at least 30 psi at the exit of the last meter tested, your high (full) flow test results may not represent the actual accuracy of the meter.

11. Check the tank to ensure the valves are closed and the tank is either empty or the weight has been tared.

If you tare the tank, ensure there is enough empty tank volume left to perform the test.

12. Record the initial register indication.
13. Open the start / stop test bench outlet valve to begin the test.

Timing the test helps to determine the average flow rate over the test. This helps to highlight if any gross flow rate fluctuations happened during the test.

14. When the test reaches the desired volume, close the outlet start / stop valve to end the test.

Close the valve at a steady rate, slowly enough so there is no water hammer effect. This has a detrimental affect to the system and meter accuracy. Do not “bump” the test to reach a certain volume / weight. This may affect the test.

15. Record the final register indication.
16. Record the tank volume / weight.
17. Calculate the accuracy of the meters.

$$Accuracy \, (\%) = \frac{V_{\text{meter}}}{V_{\text{tank}}} \times 100$$
18. Repeat steps 9 – 17 for additional flow rates.
19. Relieve water pressure from the bench before removing the meters.

Test Data

AWWA recommendations come directly from the AWWA Manual M6. Neptune recommended intermediate flow values are 10% of the full flow. All other Neptune values come directly from Neptune Literature.

Test Time was calculated based on the Gallons Test Volume and vary if cu. ft. or m3 Test Volumes are used.

Chapter 7: Maintenance and Troubleshooting

This chapter provides information for maintaining and troubleshooting the MACH 10® meter.

Maintenance

Typically, mechanical meters are subject to wear and are often rebuilt to extend their life. The electronic MACH 10 meter does not have moving parts and requires no maintenance. The C&I MACH 10 meter is designed with the electronics, transducers, battery, and display all as part of a unitized measuring element (UME) which you can replace on the meter without removing the meter maincase from service, eliminating maintenance time and cost.

Unitized Measuring Element (UME) Maintenance

When maintenance is necessary, you can quickly and easily interchange the complete UME with a factory-calibrated unit. The UME includes the register, cover, batteries, and measurement transducers.

Following are the steps to replace the UME.

1. Close all valves (mainline and bypass).
2. Open the bleed screw on top of the meter to vent air.
3. Make sure the meter is depressurized.
4. Remove the cover bolts.
5. Remove the UME from the maincase.
6. Install the factory-calibrated UME into the maincase as shown in the following image.

![Figure 21 – Unitized Measuring Element Commercial and Industrial MACH 10® Meter](image)
Chapter 7: Maintenance and Troubleshooting

7. Replace the supplied UME gasket, if necessary.
8. Replace the cover bolts as shown in the previous image.
9. Tighten the cover bolts.
10. Open the valves.

All new UMEs have been factory tested and do not require field testing. If no spare unit is available, you can purchase a factory-calibrated UME directly from Neptune or one of its authorized distributors. Neptune encourages all customers to purchase a spare UME to avoid service interruptions.

Replacement Parts

If the plastic meter lid becomes damaged or broken, it can be replaced. The UME assembly may also be replaced, but there are no other replacement parts for the MACH 10 ultrasonic meter.

General Troubleshooting

The following tables provide steps for troubleshooting common issues with the MACH 10 meter.

Table 24 – LCD Display Does Not Illuminate

<table>
<thead>
<tr>
<th>Possible Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment is too dark</td>
<td>Shine a flashlight on the face of the register. Remove the light after the display wakes up.</td>
</tr>
<tr>
<td>LCD has timed out</td>
<td>• Close the lid of the register.</td>
</tr>
<tr>
<td></td>
<td>• After a few seconds open the lid. If the LCD still does not come on, see “Possible Cause: Environment is too dark” above.</td>
</tr>
<tr>
<td>Photo-eye is blocked</td>
<td>Clean the face of the register to remove any dirt and debris, and then follow the steps in “Possible Cause: LCD has timed out” above.</td>
</tr>
</tbody>
</table>

Table 25 – MIU or LCD Display Reports Errors

<table>
<thead>
<tr>
<th>Possible Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intermittent or continuous flow</td>
<td>Depending on the application of the meter, intermittent or continuous flow may be expected. If such flow is unexpected, check the integrity of the line downstream the meter.</td>
</tr>
<tr>
<td>Reverse flow</td>
<td>Some reverse flow may be expected depending on your configuration. You may need to install a backflow preventer upstream of the meter if significant negative flow is reported.</td>
</tr>
</tbody>
</table>
Table 25 – MIU or LCD Display Reports Errors (continued)

<table>
<thead>
<tr>
<th>Possible Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excessive Forward Flow</td>
<td>Excessive flow may cause the MIU to report question marks (?) and the display to read zero flow. The unit displays the last known valid volume. Ensure the meter is installed in an application that is within the Normal Operating Flow Range for its size.</td>
</tr>
<tr>
<td>Empty Pipe</td>
<td>Remove all air from the meter during installation. Neptune recommends flushing the line multiple times to ensure no air is retained within the system. Trapped air may cause the display and MIU to report values that do not reflect actual usage.</td>
</tr>
<tr>
<td>Low Battery</td>
<td>If the battery is low, consider replacing the UME.</td>
</tr>
</tbody>
</table>

Checklist

Before leaving the installation site, be sure to do the following.

- Record the MIU ID for each register.
- Verify that you have followed all requirements of this Installation and Maintenance Guide.
- Verify that you have recorded all required information.
- Clean up any installation debris.
- Verify that the requirements of the Site Work Order have been completed.
- Inform the customer that you have completed your work. If you were unable to finish, inform the customer when you are returning to complete the project.

Contact Information

Within North America, Neptune Customer Support is available Monday through Friday, 7:00 A.M. to 5:00 P.M. Central Standard Time, by telephone or email.
By Phone

To contact Neptune Customer Support by phone, complete the following steps:

1. Call (800) 647-4832.
2. Select one of the following options:
   - 1 if you have a Technical Support Personal Identification Number (PIN).
   - 2 if you do not have a Technical Support PIN.
3. Enter the six-digit PIN and press #.
4. Select one of the following options:
   - 2 for Technical Support.
   - 3 for maintenance contracts or renewals.
   - 4 for Return Material Authorization (RMA) for Canadian Accounts.

You are directed to the appropriate team of Customer Support Specialists. The specialists are dedicated to you until the issue is resolved to your satisfaction. When you call, be prepared to give the following information:

- Your name and utility or company name.
- A description of what occurred and what you were doing at the time.
- A description of any actions taken to correct the issue.

By Email

To contact Neptune Support by email, send your message to support@neptunetg.com.
This appendix provides a general description of the MACH 10®R900™.

Product Description

The MACH 10®R900™ is manufactured by Neptune and is an integrated register that contains both the MACH 10 meter and the R900® radio technologies in one register that collects reading data. It then transmits the data for collection by the meter reader. A Neptune walk-by, mobile, or R900® Gateway fixed network data collection system receives the data and stores it to be downloaded into the utility billing system for processing.

The MACH 10®R900™ is easily installed and operates within a Radio Frequency (RF) band, which does not require an operating license. The MACH 10®R900™ meets FCC regulations part 15.247 allowing higher output power and greater range. The MACH 10®R900™ uses frequency-hopping spread spectrum (FHSS) technology to avoid RF interference and enhance security.

The transmitted data is updated at 15-minute intervals. It transmits a mobile message that includes the meter reading data and the unique 10-digit MACH 10®R900™ ID every 14 to 20 seconds. This allows the meter to be read by a hand held unit (HHU) or mobile data collection unit. The MACH 10®R900™ also transmits a high power fixed network message every seven and one-half minutes on an interleaved basis to a fixed R900 Gateway.

The MACH 10®R900™ is designed to offer advantages to utility organizations of all sizes:

- Increases meter reading accuracy.
- Eliminates reading difficulties.
- Protects utility liability by increasing meter reader safety.
- Requires no external wiring or programming.
- Provides enhanced eight-digit AMR meter reading.
- Provides proactive customer service benefits (leak, tamper, and backflow detection).

MACH 10®R900™ Programming

The MACH 10®R900™ is not field-programmable. Each MIU is given a unique 10-digit serial number / identification number.

RF Protocol Error Detection

The RF protocol includes a header, data packet, and an error detection mechanism that reduces the erroneous data.
MACH 10®R900™ Specifications

This section provides you with the specifications for the MACH 10®R900™.

Dimensions – Commercial and Industrial

The following images show the dimensions of the C&I MACH 10)R900i.

Figure 22 – Commercial and Industrial MACH 10®R900™ – Top View

Figure 23 – Commercial and Industrial MACH 10®R900™ – Front View
Figure 24 – Commercial and Industrial Meter Dimensions – End View

The width dimension of the meter with an installed R900/i integrated radio only affects the three-inch and four-inch sizes. The six-inch meter is not affected as the communications module does not exceed the meter case.
The following table defines the dimensions of the Commercial and Industrial MACH 10)R900i meters. All dimension measurements are in inches.

**Table 26 – MACH 10® R900®i™ Meter Dimensions – Commercial and Industrial**

<table>
<thead>
<tr>
<th>Meter</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D NSPM</th>
<th>E (external antenna)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 inch</td>
<td>12.00&quot; or 17.00&quot;</td>
<td>9.65&quot;</td>
<td>3.75&quot;</td>
<td>.71&quot;</td>
<td>7.50&quot;</td>
</tr>
<tr>
<td>4 inch</td>
<td>14.00&quot; or 20.00&quot;</td>
<td>10.94&quot;</td>
<td>4.50&quot;</td>
<td>.71&quot;</td>
<td>9.00&quot;</td>
</tr>
<tr>
<td>6 inch</td>
<td>18.00&quot; or 24.00&quot;</td>
<td>12.73&quot;</td>
<td>5.50&quot;</td>
<td>.71&quot;</td>
<td>11.00&quot;</td>
</tr>
</tbody>
</table>

**Electrical Specification**

Power is provided by a lithium thionyl-chloride battery.

**Transmitter Specifications**

The following table defines the specifications for the MACH 10)R900i transmitter.

**Table 27 – Transmitter Specifications**

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Period</td>
<td>• Every 14 to 20 seconds – standard mobile message.</td>
</tr>
<tr>
<td></td>
<td>• Every 7½ minutes – standard, high power, fixed network message.</td>
</tr>
<tr>
<td>Transmitter Channels</td>
<td>50</td>
</tr>
<tr>
<td>Channel Frequency</td>
<td>910 to 920 MHz</td>
</tr>
<tr>
<td>Output Power</td>
<td>Meeting FCC Part 15.247</td>
</tr>
<tr>
<td>FCC Verification</td>
<td>Part 15.247</td>
</tr>
</tbody>
</table>

**Functional Specifications**

The following table defines the functional specifications for the MACH 10)R900i.

**Table 28 – Functional Specifications**

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register Reading</td>
<td>• Eight digits (AMR).</td>
</tr>
<tr>
<td></td>
<td>• Nine digits (Visual).</td>
</tr>
<tr>
<td>MIU ID</td>
<td>10 digits.</td>
</tr>
</tbody>
</table>
The three tables in this appendix describe the volume represented by the eighth digit by meter size and the flags used by the MACH 10®R900i (digits) and MACH 10®R900i (minutes).

**Table 29 – Eighth Digit Resolution by Meter Size – Commercial and Industrial**

<table>
<thead>
<tr>
<th>Register Size</th>
<th>Eighth Digit Resolution - Least Significant Digit</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 inch and 4 inch</td>
<td>1 U.S. Gallon or 1/10 Cubic Feet</td>
</tr>
<tr>
<td>6 inch</td>
<td>10 U.S. Gallons or 1 Cubic Foot</td>
</tr>
</tbody>
</table>

**Table 30 – MACH 10®R900™ Flags (digits)**

<table>
<thead>
<tr>
<th>Backflow Flag (Resets After 35 Days)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No backflow event</td>
<td>Eighth digit reversed less than one digit.</td>
</tr>
<tr>
<td>Minor backflow</td>
<td>Eighth digit reversed more than one digit up to 100 times the eighth digit.</td>
</tr>
<tr>
<td>Major backflow event</td>
<td>Eighth digit reversed greater than 100 times the eighth digit.</td>
</tr>
</tbody>
</table>
### Leak Status Flag (Resets After 35 Days)

Based on total amount of 15-minute periods recorded in the previous 24-hour period.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leak icon off</td>
<td>Eighth digit incremented less than 50 of the 96 15-minute intervals.</td>
</tr>
<tr>
<td>Flashing leak icon</td>
<td>Eighth digit incremented in 50-95 of the 96 15-minute intervals.</td>
</tr>
<tr>
<td>Solid leak icon</td>
<td>Eighth digit incremented in all of the 96 15-minute intervals.</td>
</tr>
</tbody>
</table>

### Consecutive Days with Zero Consumption Flag (Resets After 35 Days)

Number of days the leak status was at a minimum value.
**Glossary**

M

MIU
Meter Interface Unit.

MUT
Meter Under Test.

P

psig
Pressure in pounds per square inch (psi) relative to atmospheric pressure, as typically shown on a pressure gauge.

S

serial number
Unique identification number given to each meter at the factory. The default value is the last programmed plus one. Custom serial numbers are not available.

T

transceiver
Device that transmits and receives communications, in particular a combined radio transmitter and receiver.

transducer
Device that converts one form of energy to another form of energy.

transit-time
Technology that takes advantage of the principle that an acoustic signal travels faster with the flow than against the flow.
ultrasonic flow

Use of ultrasonic technology to measure the velocity of an acoustically conductive liquid or gas moving through it. The velocity of the water is then converted to volume throughput using sophisticated algorithms and electronics.

ultrasonic meter

Electronic meter using ultrasonic technology and solid state electronics contained in a compact, totally encapsulated, weatherproof, and ultraviolet (UV) resistant housing for residential and light commercial applications.

UME

Unitized Measuring Element.
